э

A D N A B N A B N A B N

• Why do we use numbers basically?

4 / 40

- Why do we use numbers basically?
  - For Counting

Ex.

э

4 / 40

- Why do we use numbers basically?
  - For Counting

Ex.

• Addition and Multiplication operations are invented to support fast counting

- Why do we use numbers basically?
  - For Counting

Ex.

 $5 \times 3$ 

- Addition and Multiplication operations are invented to support fast counting
- Subtraction and Division are then introduced as inverse operations for Addition and Multiplication.

$$5+3=8$$
  $8-3=5$   
 $5\times3=15$   $15\div3=5$ 

- Why do we use numbers basically?
  - For Counting
- Addition and Multiplication operations are invented to support fast counting
- Subtraction and Division are then introduced as inverse operations for Addition and Multiplication.
- Operations are done on the number line.

$$5+3 = 8$$
  
 $5\times3 = 15$   
 $8-3 = 5$   
 $15\div3 = 5$

#### Division

- We will focus our study on division when investigating the properties of integers.
- As division is not always possible to result an integer. **Ex.** 9:4=2.25

(日) (四) (日) (日) (日)

#### Division

- We will focus our study on division when investigating the properties of integers.
- As division is not always possible to result an integer. **Ex.** 9:4=2.25
- Division is widely used in modern cryptography as an inverse operation for the multiplication.

(日) (四) (日) (日) (日)

### Division

- We will focus our study on division when investigating the properties of integers.
- As division is not always possible to result an integer. **Ex.** 9:4=2.25
- Division is widely used in modern cryptography as an inverse operation for the multiplication.

#### Number theory

Number theory is a branch of mathematics concerned with the study of integers. It forms the mathematical basis for modern cryptography.

• What does it means a is divisible by b?

э

<ロト < 四ト < 三ト < 三ト

- What does it means a is divisible by b?
  - A naive answer if the rational number <sup>a</sup>/<sub>b</sub> is an integer say k, then a is divisible by b.
- But what does it means  $\frac{a}{b}$  is an integer?

(日)

- What does it means a is divisible by b?
  - A naive answer if the rational number  $\frac{a}{b}$  is an integer say k, then a is divisible by b.
- But what does it means  $\frac{a}{b}$  is an integer?
  - It means a can be written as a product of two intgers one of them is b.

イロト 不得下 イヨト イヨト

- What does it means a is divisible by b?
  - A naive answer if the rational number  $\frac{a}{b}$  is an integer say k, then a is divisible by b.
- But what does it means  $\frac{a}{b}$  is an integer?
  - It means a can be written as a product of two intgers one of them is b.
  - Or,  $a = k \times b$

イロト 不得 トイヨト イヨト

- What does it means a is divisible by b?
  - A naive answer if the rational number  $\frac{a}{b}$  is an integer say k, then a is divisible by b.
- But what does it means  $\frac{a}{b}$  is an integer?
  - It means a can be written as a product of two intgers one of them is b.
  - Or,  $a = k \times b$
  - Then,  $\frac{a}{b} = k$

- What does it means a is divisible by b?
  - A naive answer if the rational number  $\frac{a}{b}$  is an integer say k, then a is divisible by b.
- But what does it means  $\frac{a}{b}$  is an integer?
  - It means a can be written as a product of two intgers one of them is b.
  - Or,  $a = k \times b$
  - Then,  $\frac{a}{b} = k$
  - We call b is factor or divisor of a.

< ロ > < 同 > < 回 > < 回 > < 回 > <

- What does it means a is divisible by b?
  - A naive answer if the rational number  $\frac{a}{b}$  is an integer say k, then a is divisible by b.
- But what does it means  $\frac{a}{b}$  is an integer?
  - It means a can be written as a product of two intgers one of them is b.
  - Or,  $a = k \times b$
  - Then,  $\frac{a}{b} = k$
  - We call b is factor or divisor of a.

< ロ > < 同 > < 回 > < 回 > < 回 > <

- What does it means a is divisible by b?
  - A naive answer if the rational number  $\frac{a}{b}$  is an integer say k, then a is divisible by b.
- But what does it means  $\frac{a}{b}$  is an integer?
  - It means a can be written as a product of two intgers one of them is b.
  - Or,  $a = k \times b$
  - Then,  $\frac{a}{b} = k$
  - We call b is factor or divisor of a.

#### Divisibality

*a* is divisible by *b* (or *b* divides *a*) denoted by  $b \mid a$  if there is an integer k such that  $a = k \times b$ 

▲ □ ▶ ▲ □ ▶ ▲ □ ▶

### Divisibality

- **b** | **a** read as **b** divides **a**.
- a can be divided into k groups each of size b if the division is possible.

A (1) > A (2) > A

Indicate whether each expression is true or false.

• 8 | 40

3

Indicate whether each expression is true or false.

#### Theorem

Let n be an integer and let d be a positive integer. Then, there are unique integers q and r, with  $0 \le r \le d - 1$ , such that n = qd + r.

#### Ex.

• 
$$\frac{16}{3} \Rightarrow 16 = 5(3) + 1$$

• 
$$\frac{-16}{3} \Rightarrow -16 = (-6)(3) +2$$

• quotient = -6 and remainder = 
$$2$$

We say

• 16 div 3 = 5 (d	uotient)	
-------------------	----------	--

• 16 mod 3 = 1 (remainder)

#### Note that

We are dealing with positive divisors, thus the remainder is always positive

## Computing div and mod.

э

< □ > < 同 > < 回 > < 回 > < 回 >

Computing div and mod for positive number.

Compute -11 mod 4 = 1 -11 div 4 = -3

#### Note that

Remainder is always positive i.e., 0  $\leq$  r  $\leq$  d - 1

イロト イポト イヨト イヨト

- 344 mod 5
  - $344 = 68 \times 5 + 4$ , so  $344 \mod 5 = 4$ .

# Modular Arithmetic

- In modular arithmetic, numbers "wrap around" upon reaching a given fixed quantity (this given quantity is known as the modulus) to leave a remainder.
- Imagine we are doing the arithmetic on circle instead of the number line.
- In modulo N, the result of any arithmetic operation takes values from 0 to N-1.

The 12-hour clock : modulo 12 If the time is 9:00 now, then 4 hours later it will be 1:00

> 9+4 =13 13 % 12= 1

> > October 2, 2020 19 / 40

## Modular Arithmetic

- 1:00 and 13:00 hours are the same
- 1:00 and 25:00 hours are the same
- 1 ≡ 13 mod 12
- 13 ≡ 25 mod 12

 $a \equiv b \mod n$ 

- n is the modulus
- a is congruent to b modulo n
- a mod n = b mod n
- a-b is an integer multiple of n (i.e., n | (a-b))

< /⊒ ► < Ξ ► <

## Example

•  $38 \equiv 14 \mod 12$

  - 38-2 = 36; multiple of 12

The same rule apply for negative numbers.

- -8 ≡ 7 mod 5
- $2 \equiv -3 \mod 5$
- $-3 \equiv -8 \mod 5$

< □ > < 同 > < 回 > < 回 > < 回 >

3

21 / 40

October 2, 2020

#### Example

- 38 ≡ 14 mod 12
  - 38-14 = 24; multiple of 12
- 38 ≡ 2 mod 12
  - 38-2 = 36; multiple of 12

The same rule apply for negative numbers.

- -8 ≡ 7 mod 5
- $2 \equiv -3 \mod 5$
- $-3 \equiv -8 \mod 5$

## Congurence Class Example

Integers modulo 5 can take values from  $\{0, 1, 2, 3, 4\}$ 

 $0 \equiv 5 \equiv 10 \equiv 15 \dots \text{mod } 5$   $1 \equiv 6 \equiv 11 \equiv 16 \dots \text{mod } 5$   $2 \equiv 7 \equiv 12 \equiv 17 \dots \text{mod } 5$   $3 \equiv 8 \equiv 13 \equiv 18 \dots \text{mod } 5$  $4 \equiv 9 \equiv 14 \equiv 19 \dots \text{mod } 5$ 

We call the previous property as congurence class relation modulo 5.

# Prime VS Composite Numbers

#### Prime Number

A prime number p is an integer that can be divided, without a remainder, only by itself and by 1.

Ex.

2,3,5,7,11,13

#### Composite Number

A positive integer is composite if it has a factor/divisor other than 1 or itself.

October 2, 2020

28 / 40

#### Ex.

 $14 = 2 \times 7$   $10 = 2 \times 5$  $35 = 5 \times 7$ 

# The Fundamental Theorem of Arithmetic

#### Theorem

Every positive integer other than 1 can be expressed uniquely as a product of prime numbers where the prime factors are written in increasing order.

#### Ex.

 $1078 = 2 \times 7^2 \times 11$ 

The factors of 1078 are 2, 7, 11

- The multiplicity of 2 is 1
- The multiplicity of 7 is 2
- The multiplicity of 11 is 1

## GCD

The greatest common divisor (gcd) of non-zero integers x and y is the largest positive integer that is a factor of both x and y.

< /⊒ ► < Ξ ► <

October 2, 2020

31 / 40

### Ex.

GCD of 12 and 30

• Divisors of 12 are: 1, 2, 3, 4, 6 and 12

## GCD

The greatest common divisor (gcd) of non-zero integers x and y is the largest positive integer that is a factor of both x and y.

### Ex.

GCD of 12 and 30

- Divisors of 12 are: 1, 2, 3, 4, 6 and 12
- Divisors of 30 are: 1, 2, 3, 5, 6, 10, 15 and 30

## GCD

The greatest common divisor (gcd) of non-zero integers x and y is the largest positive integer that is a factor of both x and y.

### Ex.

GCD of 12 and 30

- Divisors of 12 are: 1, 2, 3, 4, 6 and 12
- Divisors of 30 are: 1, 2, 3, 5, 6, 10, 15 and 30

## GCD

The greatest common divisor (gcd) of non-zero integers x and y is the largest positive integer that is a factor of both x and y.

### Ex.

GCD of 12 and 30

- Divisors of 12 are: 1, 2, 3, 4, 6 and 12
- Divisors of 30 are: 1, 2, 3, 5, 6, 10, 15 and 30

The Greatest Common Divisor of 12 and 30 is 6.

## LCM

The least common multiple (lcm) of non-zero integers x and y is the smallest positive integer that is an integer multiple of both x and y.

### Ex.

LCM of 3 and 5:

• The multiples of 3 are: 3, 6, 9, 12, 15, 18, ... etc

< /⊒ ► < Ξ ► <

## LCM

The least common multiple (lcm) of non-zero integers x and y is the smallest positive integer that is an integer multiple of both x and y.

### Ex.

LCM of 3 and 5:

- The multiples of 3 are: 3, 6, 9, 12, **15**, 18, ... etc
- The multiples of 5 are: 5, 10, 15, 20, 25, ... etc

< /⊒ ► < Ξ ► <

## LCM

The least common multiple (lcm) of non-zero integers x and y is the smallest positive integer that is an integer multiple of both x and y.

### Ex.

LCM of 3 and 5:

- The multiples of 3 are: 3, 6, 9, 12, **15**, 18, ... etc
- The multiples of 5 are: 5, 10, 15, 20, 25, ... etc

< /⊒ ► < Ξ ► <

## LCM

The least common multiple (lcm) of non-zero integers x and y is the smallest positive integer that is an integer multiple of both x and y.

### Ex.

LCM of 3 and 5:

- The multiples of 3 are: 3, 6, 9, 12, **15**, 18, ... etc
- The multiples of 5 are: 5, 10, **15**, 20, 25, ... etc

The Least Common Multiple of 3 and 5 is 15

▲ □ ▶ ▲ 三 ▶ ▲ 三

# Calculating GCD and LCM Using Prime Factors

Let x and y be two positive integers with prime factorizations expressed using a common set of primes as:

$$\mathbf{x} = p_1^{a_1} \times p_2^{a_2} \times \dots p_n^{a_n}$$
$$\mathbf{y} = p_1^{b_1} \times p_2^{b_2} \times \dots p_n^{b_n}$$

$$\begin{aligned} \mathsf{GCD}(x, y) &= p_1^{\min(a_1, b_1)} \times p_2^{\min(a_2, b_2)} \times \dots p_n^{\min(a_n, b_n)} \\ \mathsf{LCM}(x, y) &= p_1^{\max(a_1, b_1)} \times p_2^{\max(a_2, b_2)} \times \dots p_n^{\max(a_n, b_n)} \end{aligned}$$

イロト 不得 トイヨト イヨト 二日

## Excercise

Some numbers and their prime factorizations are given below.

- $532 = 2^2 \times 7 \times 19$
- $648 = 2^3 \times 3^4$
- $1083 = 3 \times 19^2$
- $15435 = 3^2 \times 5 \times 7^3$

Use these prime factorizations to compute the following quantities.

- gcd(532, 15435)
- gcd(648, 1083)
- Icm(532, 1083)
- Icm(1083, 15435)
